Experiment 09:

7. Laboratory Exercise

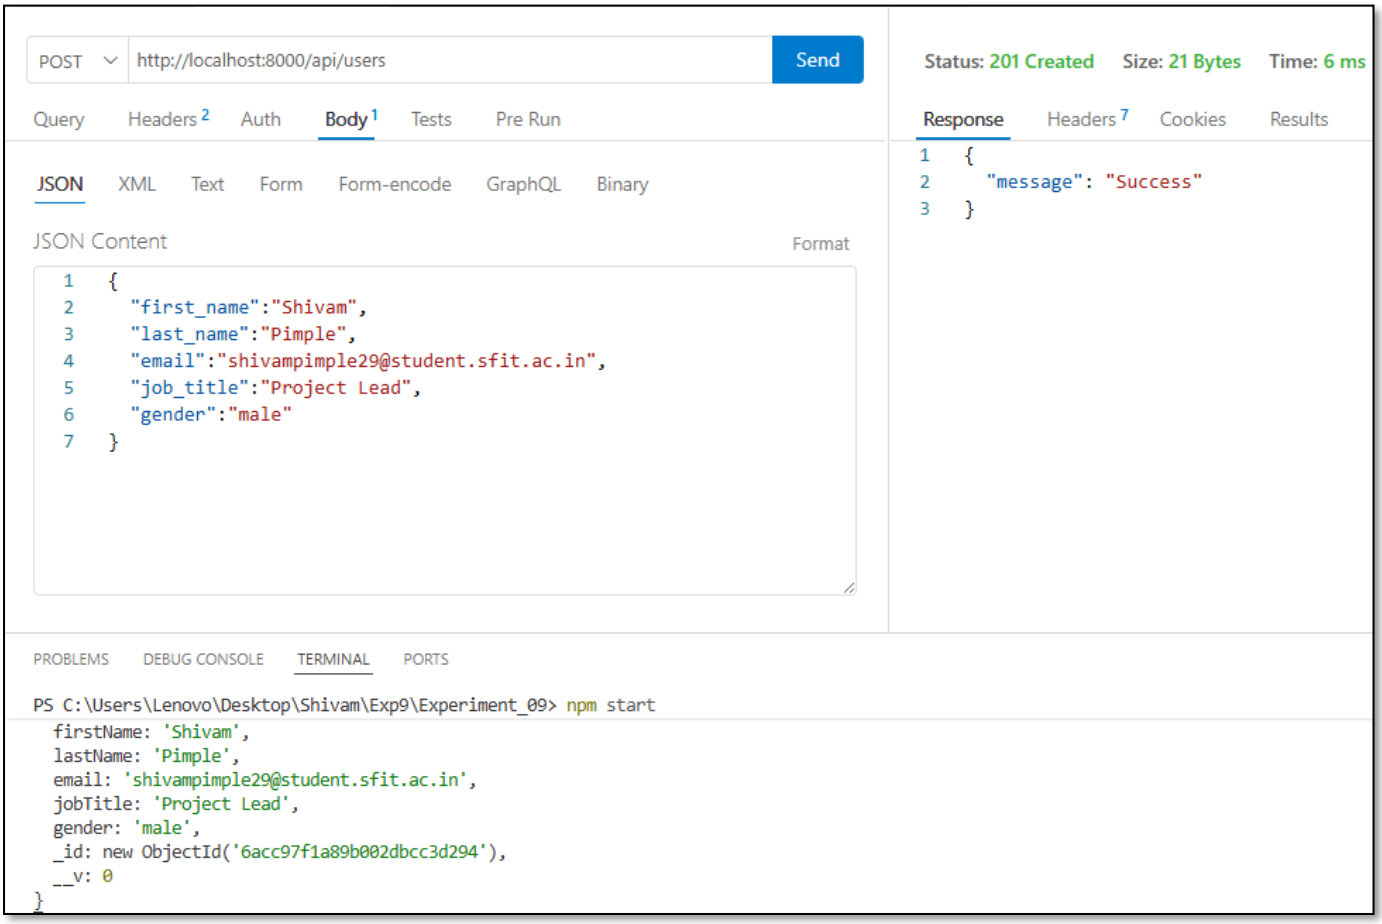

```
>_MONGOSH

> show dbs
< Institute          68.00 KiB
  admin              40.00 KiB
  college            56.00 KiB
  config            108.00 KiB
  first-application   60.00 KiB
```

Observation: The show dbs command displays the available databases. The first-application database is present, confirming that the application's database has been created.

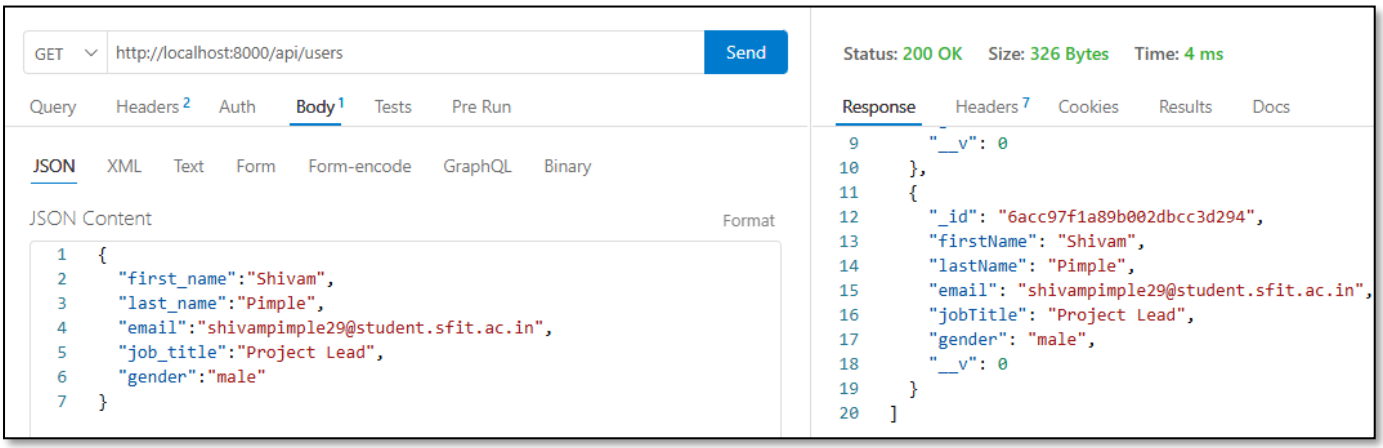

---

1. POST request:

Observation: The POST request sends the user details in JSON format to the server, which creates a new record in the database and returns a success response.

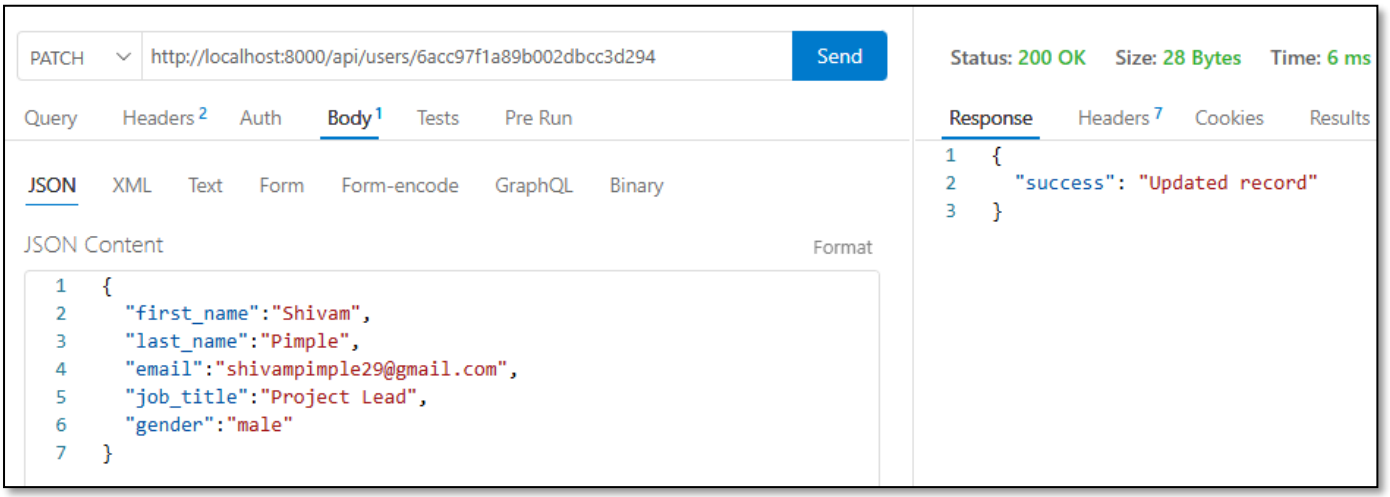

2. GET request:

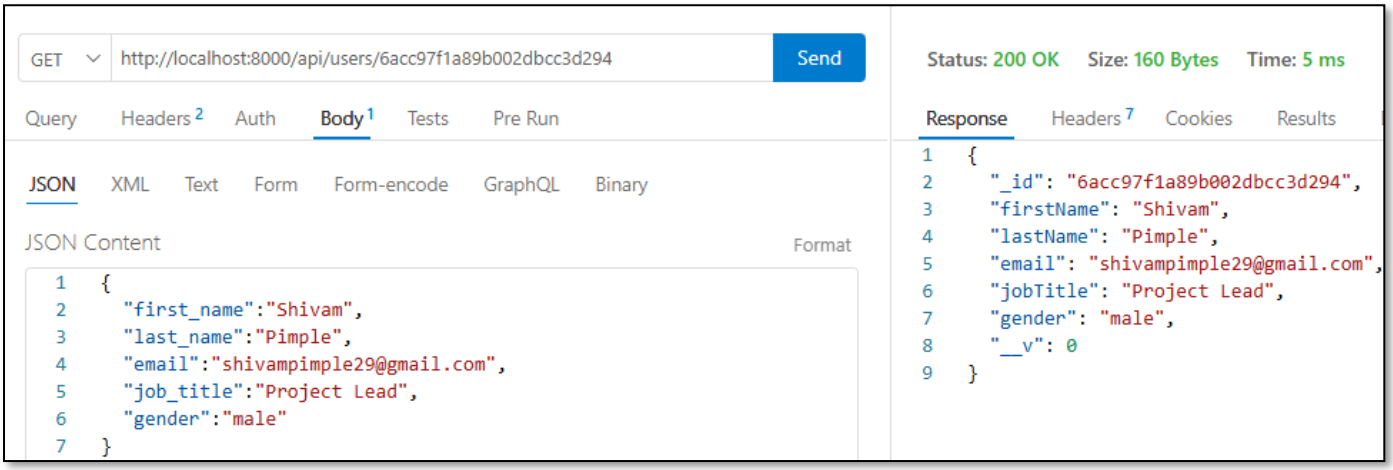

Observation: The GET request retrieves the stored user records from the database, confirming that the submitted data has been saved successfully.

---

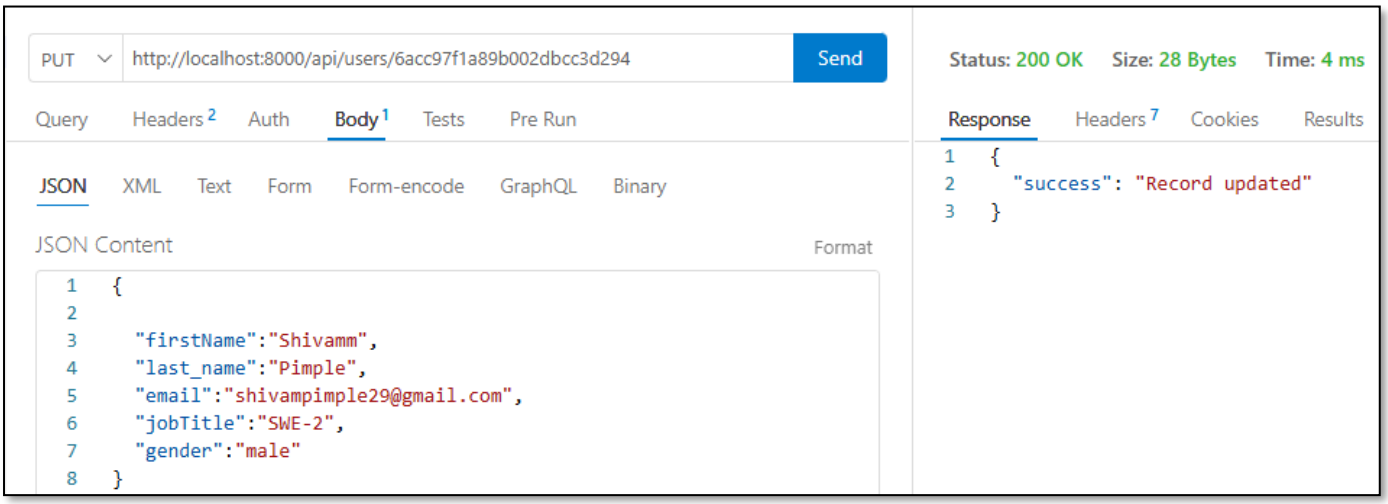

3. PATCH request:

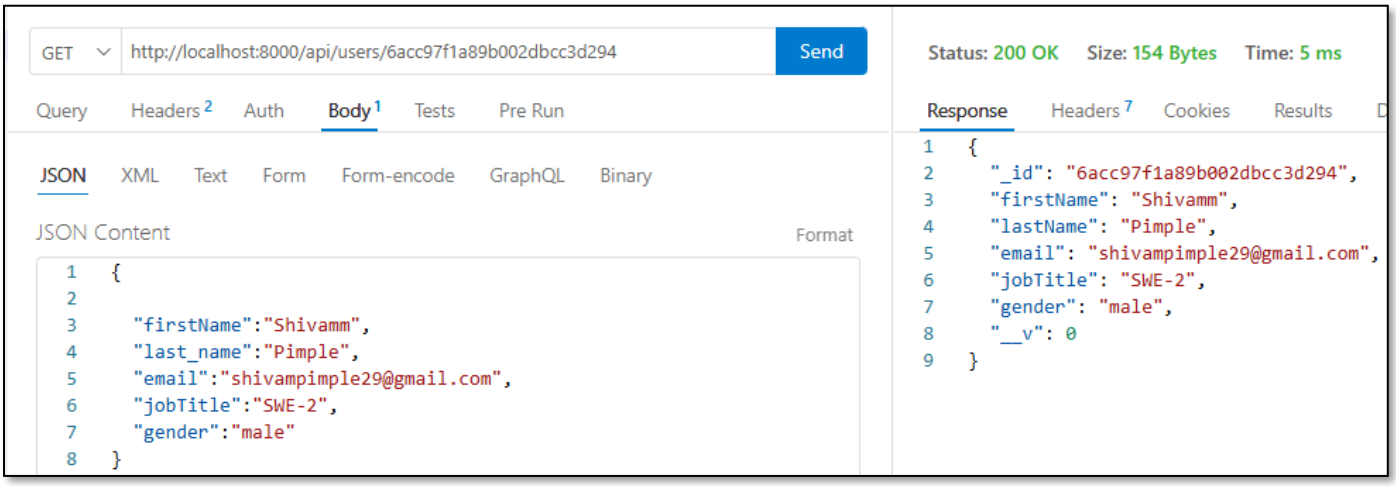

Observation: The PATCH request updates the specified fields of an existing user record in the database and returns a success response.

4. PUT request:

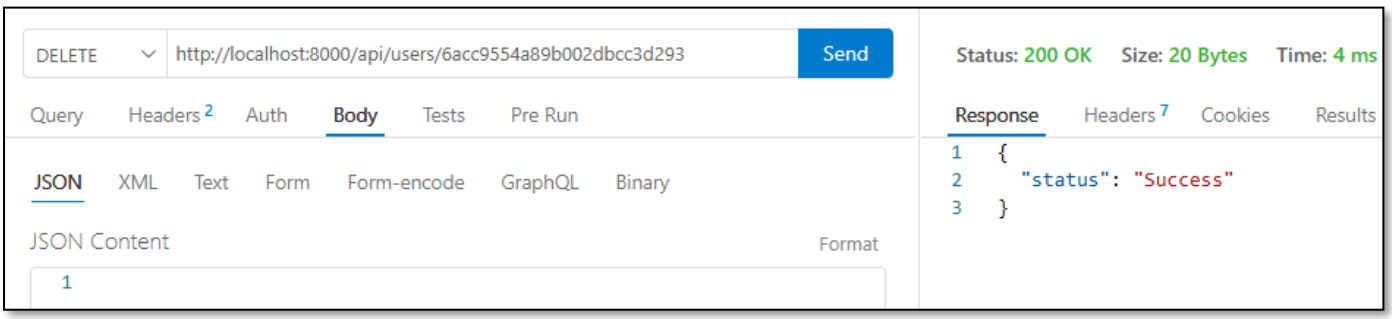

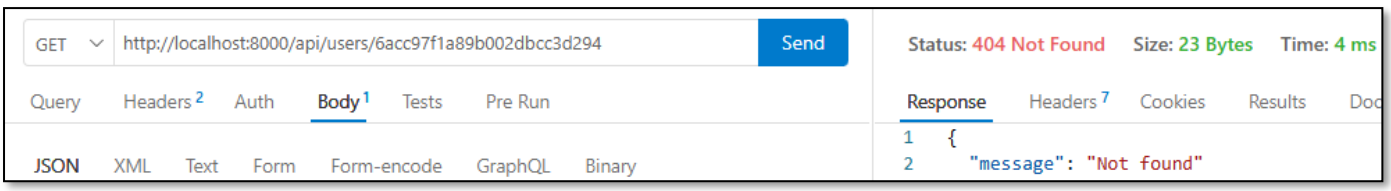

Observation: The PUT request updates an existing user record using the complete set of details provided in the request body, replacing the previous record representation.

---

5. DELETE request:

Observation: The DELETE request successfully removes the specified user record from the database.
